

Survival guide to the Unix shell bash

Command syntax

Every Unix command has a name, a set of options, and a set of arguments:

name options arguments

Options are normally preceded by a minus sign – to distinguish them from arguments. A list of common Unix commands is given in the attached table.

Files and directories

/	Root of file system
~	Home directory
.	Current (or working) directory
..	Parent of current directory
<i>name</i>	File <i>name</i> in current directory
<i>/f/g/h/name</i>	Full path (file) name

The most important file processing commands are: `ls`, `more`, `mv`, `cp`, `rm`.

The most important directory processing commands are: `pwd`, `cd`, `mkdir`, `rmdir`

File permissions

Every file has a type, an owner, a group and a set of permissions.

The main file types are plain (text) files and directories.

Every file may have read/write/execute permission for user (owner), group and other users. These are displayed by the `ls -l` command and changed by the `chmod` command.

Directories can be stacked:

<code>dirs</code>	Display directory stack
<code>pushd dir</code>	Push and move to directory <i>dir</i>
<code>pushd +n</code>	Move to <i>n</i> th directory on stack
<code>pushd</code>	Exchange top and previous directory on stack
<code>popd</code>	Pop to previous directory on stack

`cd` changes top directory on stack.

Filename expansion

Sets of file names may be abbreviated:

*	Any string of characters
?	Any single character
[<i>string</i>]	Any character in <i>string</i>
{ <i>string1</i> , <i>string2</i> , ... }	The given set of (sub)strings

Autocompletion

Pressing `TAB` while entering a file name automatically completes the file name. If there are more than one possible completion, it beeps. To see the possible completions, type `^D`. Then type one or more characters, and press `TAB` again.

File redirection

<code>command < from</code>	<code>command</code> reads standard input from file <i>from</i> .
<code>command > to</code>	<code>command</code> writes standard output to file <i>to</i> , overwriting old file <i>to</i>
<code>command >> to</code>	<code>command</code> appends standard output to file <i>to</i>
<code>command >& to</code>	<code>command</code> writes stdout and stderr to file <i>to</i>

(This last construct also works for appending and piping (below); just add an "&" character after ">>" or "|".)

Command composition

<code>command1 ; command2</code>	Execute <i>command1</i> then <i>command2</i>
<code>command1 command2</code>	Pipe standard output from <i>command1</i> to standard input of <i>command2</i>

Job control

<code>command &</code>	Execute <i>command</i> in background
<code>^Z</code>	Suspend foreground process (job)
<code>stop %n</code>	Suspend background job <i>n</i>
<code>kill %n</code>	Terminate background job <i>n</i>
<code>fg %n</code>	Resume job <i>n</i> in foreground
<code>bg %n</code>	Resume job <i>n</i> in background
<code>jobs</code>	Display current jobs

History mechanism

<code>history</code>	Display last <i>n</i> commands
<code>!!</code>	Repeat previous command
<code>!m</code>	Repeat command <i>m</i>
<code>!cmd</code>	Repeat last command starting with string <i>cmd</i>
<code>!^</code>	First argument (or option) of previous command
<code>!\$</code>	Last argument of previous command
<code>!*</code>	All arguments of previous command
<code>^old^new</code>	Repeat previous command with string <i>old</i> replaced by string <i>new</i>

Previous commands may also be found, edited, and executed using the up/down arrow keys.

`.bashrc`

Commands can be renamed and new commands defined:

```
alias name=command
```

The *command* may contain `;`, `|`, `!*` (as above). For example:

```
alias ll='ls -l \!* | more'
alias m=more
alias rm='rm -i'
```

Many variables can be defined, for example:

```
set ignoreeof notify noclobber
```

It is normal to put such definitions in the file `~/ .bashrc`.

Regular expressions

These are used by *grep*, *sed*, *ed*, *vi*, and many other commands.

.	Any character
^	Start of line
\$	End of line
<i>c</i>	Character <i>c</i>
[<i>string</i>]	Any character in <i>string</i> , e.g., [a-zA-Z0-9]
[^ <i>string</i>]	Any character not in <i>string</i>
<i>e</i> *	0 or more occurrences of the regular expression <i>e</i>
<i>e</i> +	1 or more occurrences of the regular expression <i>e</i>
\ (<i>e</i> \)	Regular expression <i>e</i>
\ <i>n</i>	Bracketed regular expression starting with <i>n</i> th \
<i>e1 e2</i>	Regular expression <i>e1</i> followed by regular expression <i>e2</i>

Control characters

DELETE	Delete (or rubout) last character typed
^W	Delete last word typed
^U	Delete last line typed
^S/^Q	Suspend/resume output to screen
^C	Terminate current process
^Z	Suspend current process
^D	End of (standard input) file

Common Unix commands

man <i>command</i>	Display manual entry for <i>command</i>
ls	List (display) names of all files in current directory
ls <i>file</i> ...	List named files or files in named directories. Options follow:
-a	List all, including files whose names start with .
-d	List (as) directory, not files in directory
-l	List long, more information
-t	List in time order, most recent first
file <i>file</i> ...	Display (estimated) type of named files
cp <i>file1 file2</i>	Copy <i>file1</i> to <i>file2</i> , overwrite old <i>file2</i> if it exists
ln <i>file1 file2</i>	Link <i>file1</i> to <i>file2</i> (<i>file1</i> and <i>file2</i> are now aliases)
ln -s <i>file1 file2</i>	Symbolic link from <i>file1</i> (a directory) to <i>file2</i>
mv <i>file1 file2</i>	Move (rename) <i>file1</i> to <i>file2</i> , overwrite old <i>file2</i> if it exists
rm <i>file</i> ...	Remove named files, irrevocably
cp/mv/rm -i <i>file</i> ...	Overwrite/remove named files only after confirmation
chmod <i>int file</i> ...	Change permission of named files
pwd	Print working (current) directory
cd <i>dir</i>	Change (move) to named directory
mkdir <i>dir</i>	Make a new named directory

<code>rmdir <i>dir</i></code>	Remove named directory, irrevocably
<code>pushd <i>dir</i>/popd/dirs</code>	Push/pop/display directories on stack
<code>ed <i>file</i></code>	Edit named file
<code>vi <i>file</i></code>	Visually edit named file
<code>cat <i>file</i> ...</code>	Concatenate (display) contents of named files
<code>more <i>file</i> ...</code>	Display contents of named files, a screen at a time
<code>less <i>file</i> ...</code>	Less is more, enables backward movement in files
<code>head <i>file</i></code>	Display first 10 lines of named file
<code>head -<i>n</i> <i>file</i></code>	Display first <i>n</i> lines of named file
<code>tail <i>file</i></code>	Display last 10 lines of named file
<code>tail +<i>n</i> <i>file</i></code>	Start displaying at line <i>n</i>
<code>pr <i>file</i> ...</code>	Display contents of named files with headers
<code>pr -<i>n</i> <i>file</i> ...</code>	Display contents of named files with headers in <i>n</i> columns
<code>lpr <i>file</i> ...</code>	Print contents of named files (text files only!)
<code>lpq</code>	Display printer status
<code>lprm <i>job</i></code>	Remove <i>job</i> from printer queue
<code>lpr/lpq/lprm -P<i>printer</i></code>	Use named printer
<code>awk '<i>commands</i>' <i>file</i> ...</code>	Apply <i>awk</i> commands to named files
<code>bc</code>	Arbitrary precision arithmetic calculator
<code>cal <i>month</i> <i>year</i></code>	Display calendar for given month and year
<code>cmp <i>file1</i> <i>file2</i></code>	Compare named files
<code>date</code>	Display current date and time
<code>diff <i>file1</i> <i>file2</i></code>	Display all differences between named files
<code>fmt <i>file</i> ...</code>	Format named files
<code>grep <i>pattern</i> <i>file</i> ...</code>	Print lines of named files matching <i>pattern</i>
<code>logout</code>	Terminate session
<code>mail</code>	Read mail
<code>mail <i>user</i></code>	Send mail to <i>user</i>
<code>passwd</code>	Change your password
<code>pine</code>	A user-friendly mail client
<code>sed '<i>commands</i>' <i>file</i> ...</code>	Stream editor: apply <i>ed</i> commands to named files
<code>sed -f <i>program</i> <i>file</i> ...</code>	Apply commands in file <i>program</i> to named files
<code>set <i>variable</i> [= <i>value</i>]</code>	Set or assign shell variable
<code>sort <i>file</i> ...</code>	Sort named files alphabetically by line
<code>stty ...</code>	Set terminal characteristics
<code>tr <i>string1</i> <i>string2</i></code>	Copy standard input to standard output, translating all chars in <i>string1</i> into corresponding chars in <i>string2</i>
<code>wc <i>file</i> ...</code>	Count lines, words and characters of named files
<code>who</code>	Display who is using the machine

More information

Read the (extensive) `bash` manual:

`man bash`
